Frequently Asked Questions:

Question 1: What is a labelled dataset, and what do you mean by labelling it?

Answer: You should label the data, which means you should assign a number to each team as follows:

Label	Teams
0	No team
1	Chennai Super Kings (CSK)
2	Delhi Capitals (DC)
3	Gujarat Titans (GT)
4	Kolkata Knight Riders (KKR)
5	Lucknow Super Giants (LSG)
6	Mumbai Indians (MI)
7	Punjab Kings (PBKS)
8	Rajasthan Royals (RR)
9	Royal Challengers Bengaluru (RCB)
10	Sunrisers Hyderabad (SRH)

Question 2: What do you mean by hand crafted feature engineering?

Answer: Hand-crafted feature engineering means you manually design and extract specific features from images using domain knowledge, instead of letting a model automatically learn them. Then you feed those features into a model (like SVM, logistic regression, etc.)

Question 3: How will we generate columns c1 to c64 for training images? Should it be manual?

Answer: You should figure this out.

Question 4: Do the photos need to be from the same IPL season, as some teams do change the jersey colour from season to season?

Answer: Collect images from a single session only. For example, if you choose Session 1 (2008), gather all images from that year alone. You may select any session, but ensure that all chosen images come from the same session.

Question 5: Is the ask not only to classify the jersey but also the players? If we have photos belong to crowd where they are wearing different team jerseys, the model might still classify it as players.

Answer: If that's the case, you should discard this image or exclude it from consideration.

Question 6: Is the existence of players necessary? I mean, even if we pass jersey photos, the model can still classify them.

Answer: Not necessary for the existence of players in the image.

Question 7: The problem states not to use CNN or similar models for feature generation. However, can we use these models for annotation/pre-labelling the sample data?

Answer: Strictly no CNNs or similar methods for feature creation; features must be generated using only low level image processing functions. Use of low level image processing functions like HOG, Canny, other edge detectors, SOBEL filters, colour histograms, Fourier transforms, Local Binary Patterns, GLCM, etc. is allowed.
